

MOM

July 4th 2026

The meeting started off with Navanieeth skimming through chapter 1 of *cryptography and network security*

First Cryptography algorithms and protocols were done covering symmetric, asymmetric encryption and other algorithms and protocols.

Then we went over computer security and CIA (confidentiality , integrity and availability) and also 2 other terms i.e. authenticity and accountability.

We then went over the important part of security, that is the challenges of computer security, the concept of a new security method having to go through all the checks to avoid being attacked.

Then was OSI (open systems interconnection) security architecture and security attacks.

Went over the segregation of the attacks that is passive (release of message and traffic analysis) and active (masquerade , replay , modification and denial of message)

Then was security services where we went over

Authentication , access control , data confidentiality , data integrity and nonrepudiation

The last few topics were security mechanisms and models for network security.

The next call Pranav (TR) will go over chapter 2 from the same book
